👤 13. Founder-market fit	📊 14. Validation	🚀 15. Vision & funding ask	⚠ 16. Disclaimers & assumptions

MAAT was born from a real project. HARMAR EMPREENDIMENTOS LTDA spent two years living the operational pain that MAAT now solves: fragmented information, weak traceability, delayed visibility, procurement complexity, and financial control gaps.

This page reframes MAAT as an investment story rather than a feature list, with Swiss construction and engineering SMEs as the beachhead market. It is a companion to Where MAAT fits. The market sizing, pricing, funding, and efficiency figures below are illustrative planning assumptions, not researched fact — see Disclaimers & assumptions at the end before any external use.

🎯 1. The problem

A construction firm only learns a project lost money once it is over.

Project information is scattered across WhatsApp, email, Excel, and paper, so no one has a live, trustworthy view of where each job actually stands or whether it is profitable.

The problem was first experienced directly by HARMAR during a real construction project in Bahia, Brazil, then generalized for project-based companies such as Swiss construction and engineering SMEs.

How the work runs today

- Site updates and decisions in WhatsApp groups

What it causes

- No real-time view of project profitability

- Budgets and cost tracking in personal Excel files
- Variation orders and approvals buried in email
- Delivery notes and subcontractor invoices on paper
- Accounting in a separate system, weeks behind

- Delays from poor coordination across trades
- Disputes and warranty claims with no paper trail
- Cost overruns discovered too late to fix
- Project managers buried in admin, not on site

A site or project manager cannot answer simple questions quickly:

Is this site still on budget right now?

Who approved this variation order?

Where is the proof for this dispute?

The Swiss reality that makes it worse

High labour costs make every wasted hour expensive; a skilled-worker shortage makes admin on the wrong people unaffordable; administrative and compliance requirements keep rising; and tight margins leave no room for a project that quietly slips into the red.

🕒 2. Why we built MAAT

Born from real project pain — not a theoretical software idea.

MAAT was born from a real construction project, not from a theoretical software idea.

During two years of planning, procurement, construction execution, supplier coordination, documentation, and financial control for a multi-year construction and property development project in Bahia, Brazil, HARMAR EMPREENDIMENTOS LTDA experienced the same fragmentation that affects project-driven organizations every day.

Information lived in too many places: WhatsApp, email, Excel, paper documents, supplier invoices, accounting files, and informal conversations.

The team needed a single way to connect decisions, commitments, documents, approvals, costs, invoices, and payments.

Existing tools handled isolated activities but did not provide end-to-end control from project intent to financial outcome.

Operational scale during the HARMAR project

During the project, HARMAR EMPREENDIMENTOS LTDA coordinated approximate operational volumes that exposed the need for a unified control platform:

35+

50+

suppliers coordinated across trades and services

contracts and commitments tracked manually

400+

supplier invoices processed across the project lifecycle

2,000+

project documents, receipts, and evidence files

Multiple

engineering and design disciplines coordinated in parallel

This operational complexity — not luxury features — drove the need for end-to-end control from project intent to financial outcome.

*These are illustrative planning figures, not audited results — see **Disclaimers & assumptions**.*

Real example

A supplier invoice arrived weeks after the related work was completed. The team had to reconstruct what should have been immediately available.

Hours were spent rebuilding:

- approval history
- budget impact
- supplier communications
- supporting documents across WhatsApp, email, Excel, and paper

This experience directly influenced MAAT's traceability and document-chain model.

MAAT was built to solve that problem.

🔗 3. From project pain to platform

From real project pain to a scalable platform — and a European beachhead.

The HARMAR project was the origin environment. MAAT generalizes that experience for repeatable project-based control, starting with Swiss construction and engineering SMEs.

HARMAR project

- Real project, real complexity, real operational pain
- Multi-year construction and property development in Bahia, Brazil
- First design-partner environment for MAAT requirements

MAAT platform

- Generalized solution for project-based organizations

- Repeatable workflows from intent to settlement
- Traceability model born from reconstruction pain

Target market

- Swiss construction SMEs — beachhead
- Swiss engineering and project-based firms
- Project-driven organizations with procurement and finance complexity

Long-term vision

- DACH expansion from a proven Swiss base
- Europe — project-based SMEs
- Revenue-to-margin operating system for project-based companies

4. The solution

MAAT is a business control platform that connects the full chain in one governed workspace.

Instead of stitching together disconnected systems, MAAT links commercial intent, delivery work, commitments, and settlement so control flows from revenue to margin.

MAAT is the platform HARMAR wished it had from day one of the project.

MAAT connects the operational chain that HARMAR had to manage manually: project planning, procurement, supplier coordination, document evidence, approvals, invoices, payments, and financial visibility.

Sales → Projects → Procurement → Finance → Payment

One source of truth across departments

One workflow from intent to settlement

One audit trail for every action

One repository for documents and decisions

One place to collaborate — tasks, to-dos, notifications, chat, and a built-in help desk, on desktop and mobile

MAAT is not another system — it is the layer that connects them. It does not replace your CRM or ERP; it carries continuity, evidence, and control across every hand-off.

And it works on site as in the office: the same workspace runs on phone, tablet, and desktop, so approvals, site updates, and document capture happen where the work is — not after someone gets back to a screen.

⇒ 5. Before & after

Problem → MAAT → outcome — what changes for the team.

Before MAAT

- WhatsApp groups for site decisions
- Email for approvals and variations
- Personal Excel files for budgets
- Paper delivery notes and subcontractor records
- Accounting system weeks behind project reality

With MAAT

- One workspace across sales, projects, procurement, and finance
- One approval flow with governed sign-off
- One audit trail linking decisions to documents and payments
- One repository for evidence and project history
- One project dashboard for budget, commitments, and margin visibility

🔗 6. How it works

The model already in the product: Intent → Execution → Outcome.

Intent

Sales and CRM capture commercial intent — leads, opportunities, quotations, and commitments.

Execution

Projects and procurement turn intent into delivery — phases, tasks, requests, orders, and receipts, governed by approvals.

Outcome

Finance records the outcome — invoices, payments, allocations, and visibility of cost against revenue.

Underneath, the document chain runs deal → project → request → order → invoice → payment, linked by shared projects, related-document references, and object-number chains.

🕒 7. Why customers buy

Don't sell features — sell money, time, and risk. Swiss buyers decide on those.

MAAT gives each project manager back 5–10 hours a week and stops the costly mistakes — the overruns, the lost disputes, and the approvals no one can trace.

Operational impact (illustrative)

5–10 h / week

admin and re-keying given back to each project manager every week.

~CHF 25k–65k / year

recovered capacity per project manager, at a loaded ~CHF 120/hour rate over ~46 working weeks.

Days → minutes

4–5 tools → 1

to assemble the evidence pack for a dispute or audit request from one repository.

disconnected systems (WhatsApp, Excel, email, paper) replaced by one workspace, ending duplicate data entry.

These are illustrative planning figures, not audited results — see Disclaimers & assumptions.

Capability	What the buyer hears	Concrete example
Live budget-vs-actual	Better margins	See a site slipping into the red while you can still fix it.
Procurement workflow	Lower costs	Spend is committed only after quote comparison and sign-off.
Approvals & sign-off	Less risk	Every variation order routes for approval automatically.
Document repository	Win disputes	Pull every delivery note and sign-off for a job in minutes.
One source of truth	Time saved	Managers stop re-keying between site, office, and accounting.
Full audit trail	Compliance made easy	"Who approved this?" answered instantly; every project stays audit-ready.
FR / DE / IT in one tenant	Works across Switzerland	The same record is read in three languages by three offices.
Multi-currency	Ready to scale	Sell in one currency, buy in another, report in a third — in one tenant.
Mobile site capture & approvals	Work from the site	Approve a variation order or log a delivery from a phone on site — no trip back to the office.

8. Competitive positioning

Compared with the tools Swiss firms actually evaluate — not abstract categories.

What matters to the buyer	Excel	Asana / Monday	Procore	MAAT
Real-time project profitability	Partial	—	Partial	Yes
Procurement & cost control	—	—	Partial	Yes
Approvals & governance	—	Partial	Partial	Yes
Document & audit trail	—	Partial	Yes	Yes
Finance link to margin	—	—	Partial	Yes
FR / DE / IT in one tenant	Partial	Partial	—	Yes
Multi-currency billing & buying	Partial	—	Partial	Yes
Mobile site capture & approvals	—	Yes	Yes	Yes

The Swiss differentiators: built for Swiss project-based SMEs, multilingual FR / DE / IT in one tenant, Swiss/EU data residency, designed for Swiss compliance and invoicing, and simpler and cheaper than enterprise ERP or Procore.

These are illustrative planning figures, not audited results — see Disclaimers & assumptions.

🕒 9. Why now

Three trends are converging — the window for a Swiss-native control platform is open now.

Every investor asks why now. For Swiss project-based SMEs, the answer is timing, not theory:

- Construction and engineering margins are tightening — wasted admin and late visibility hurt faster.
- Administrative and compliance burden keeps rising — audit-ready traceability is no longer optional.
- SMEs are finally adopting cloud software — but still lack end-to-end control from revenue to margin.
- AI increases the value of structured, traceable operational data — MAAT is building that foundation.

🛡️ 10. MAAT advantage

Why competitors cannot easily replicate MAAT with a task app or a point tool.

MAAT is harder to copy than it looks because the moat is the connected data model and governance architecture — not a single screen:

- Unified project + procurement + finance data model in one tenant
- Governance-first architecture — approvals, audit trail, and permissions by design
- Multi-language foundation (FR / DE / IT) built for Swiss firms from day one
- Multi-currency billing and buying in the same workspace
- Deep document traceability across the commercial-to-settlement chain
- Years of business logic shaped by real operational workflows — not slideware categories

Point tools can add features. Replicating end-to-end control, evidence, and margin visibility together is a multi-year product problem.

🗣️ 11. Market, model & go-to-market

Start in Swiss construction — a big, underserved, slow-to-digitalise home market — then expand to DACH and Europe.

~CHF 6.5B

TAM — DACH project-based SME software spend

~CHF 0.9B

SAM — Swiss construction & engineering SMEs

~CHF 5.4M

SOM — obtainable ARR within three years

Bottom-up assumptions

Blended price	~CHF 45 / user / month
Average paid users per customer	~25
Annual contract value (ACV)	~CHF 13,500
Swiss construction & engineering SMEs	~40,000
DACH project-based SMEs	~480,000
Three-year customer target	~400

Per-seat SaaS pricing

CHF 29

per user / month

Core workspace, repository,
and basic approvals.

CHF 59

per user / month

Full procurement, finance,
multi-currency, and
workflows.

Custom

volume / multi-entity

Multi-entity, SSO, advanced
governance, and SLAs.

Additional revenue

- Implementation and onboarding
- Training
- Premium support
- Custom integrations

Go-to-market: win the Swiss construction network

- Construction associations (SBV, SSE, usic) for credibility and member access
- Trade fairs such as Swissbau and regional events for live demos
- Architect and engineering partners who refer the firms they work with
- LinkedIn and content reaching owners and project managers
- Founder-led direct sales to onboard the first design partners
- Referrals compounding in a tight-knit, regional industry

Founder-reachable acquisition channels

Beyond associations and fairs, the first cohort is reachable through direct founder networks — not abstract “market access”:

- Swiss construction firms in the founder's professional network
- Engineering and project-delivery firms facing the same fragmentation
- EPFL and Swiss technical alumni network for credibility and introductions
- Architect, engineer, and supplier relationships from real project execution

The motion: land three design partners founder-led, turn them into named references, use associations and fairs for credibility, and let referrals compound. Predictable monthly SaaS pricing removes the

budget objection for SMEs.

Structured data before AI hype

AI becomes valuable only when operational data is structured, governed, and traceable. MAAT is building that foundation — connected projects, documents, approvals, and finance — so future AI-assisted insight sits on evidence, not scattered files.

These are illustrative planning figures, not audited results — see Disclaimers & assumptions.

 12. Product in practice

See the product — not just the pitch.

This in-app pitch links to live product areas and documentation. Open them in a demo tenant to review dashboards, budgets, approvals, and document flows.

Project control

Projects, phases, tasks, and team coordination in one workspace.

Project Management

Budget and margin visibility

Budget lines, commitments, and cost tracking tied to project delivery.

Budget Management

Approval workflows

Governed sign-off routes connecting procurement decisions to accountability.

Workflow Processes

Document chain and evidence

Repository objects linked across the commercial-to-settlement chain.

Document Upload Guide

These are illustrative planning figures, not audited results — see Disclaimers & assumptions.

 13. Founder-market fit

Why we are uniquely positioned to solve this problem.

Investors invest in founders first. MAAT combines deep operational and technical experience with direct construction-project execution:

- EPFL-trained engineer with 20+ years of management experience
- Reliability engineering and complex industrial process background
- SAP integration, procurement, finance, and project execution experience
- Energy management and large international project delivery
- Direct execution of a multi-year HARMAR construction project — the origin environment for MAAT
- Built MAAT because existing tools did not provide end-to-end control from revenue to margin

The founder did not theorize the problem — he lived it, then built the platform HARMAR needed.

14. Validation

Real operations first — then product maturity — then engineering depth.

Real-world validation

Before becoming a commercial product, MAAT was shaped by real project execution. HARMAR used its own construction experience as the first design-partner environment, turning concrete operational problems into product requirements.

- Land acquisition
- Permitting and administration
- Architecture and engineering coordination
- Procurement
- Construction execution
- Supplier and contractor management
- Financial control
- Documentation and evidence management

Product maturity

Investors care about market, customer, and founder risk — but the product is already real and usable, not a concept deck:

112

In-product
documentation pages

6

UI locales in parity

17

Default approval
workflows

19

Governed document
families

Engineering depth (shipped)

For technical diligence — the platform depth that de-risks execution:

777

Database migrations
shipped

162

PostgreSQL tables

317

Server functions
(RPCs)

117

Translation
namespaces per locale

These layers reduce founder and execution risk — they are not commercial traction. The honest next milestone is external commercial proof: three Swiss construction design partners, signed letters of intent, and measured time saved per project manager.

*These are illustrative planning figures, not audited results — see **Disclaimers & assumptions**.*

🔗 15. Vision & funding ask

Become the operating system for Swiss construction projects.

Geographic ladder

Today

Project control, procurement, finance and margin, documents, and governance, connected in one workspace.

Tomorrow (roadmap)

Resource planning, deeper procurement, BIM integration, AI-assisted project insight, and financial forecasting across the same connected data.

Roadmap timing (illustrative)

2026 — prove the beachhead

- Three Swiss construction design partners live
- Onboarding and first paying customers
- Harden core project, procurement, and finance flows

2027 — deepen delivery control

- Resource planning and deeper procurement
- BIM integration groundwork
- Repeatable sales motion and early DACH expansion

2028 — intelligence on connected data

- AI-assisted project insight on structured operational data
- Financial forecasting across projects and entities
- Scale across DACH project-based SMEs

We start as the control layer that makes Swiss construction firms more profitable and audit-ready — and become the operating system for how project-based companies run from revenue to margin, across the DACH region and Europe.

↗ Funding ask

The funding objective is to move from founder-led product creation and HARMAR-based validation to external commercial validation with Swiss design partners.

We are raising to convert a product born from real project pain into validated market demand.

Illustrative allocation (CHF 500k target)

45%

Product completion, onboarding, and design-partner hardening

35%

Sales, founder-led design partners, and first GTM hires

10%

Infrastructure, security, and hosting readiness

10%

Contingency and compliance buffer

Use of funds

- Finalize the product and harden onboarding
- Acquire the first cohort of customers in a beachhead vertical
- Build a repeatable sales motion and first sales hires
- Expand into the DACH region

Milestones (18 months)

- Three design partners live
- First ten paying customers
- Repeatable sales motion in place
- 50 customers and DACH expansion underway

📖 Illustrative target: CHF 500,000 for an 18-month runway. About 50 customers at the modeled ACV approaches CHF 0.7M ARR, de-risking a priced Series A. Confirm the amount and milestones against your own plan.

*These are illustrative planning figures, not audited results — see **Disclaimers & assumptions**.*

⚠️ 16. Disclaimers & assumptions

Read the figures on this page as planning assumptions, not promises.

MAAT is in active development. The market sizing, pricing, funding, and efficiency figures throughout this pitch are illustrative planning assumptions — not researched fact or audited results. Each claim above is qualified by the matching note below.

Figures are illustrative

All market sizing, pricing, and funding figures on this page are illustrative planning assumptions and should be validated with primary sources before any external use; investors will test them.

Operational impact

These are illustrative planning figures derived from the 5–10 hours a project manager loses to admin and re-keying each week — not audited results. The recovered-capacity range assumes a loaded Swiss cost of ~CHF 120/hour; confirm with design-partner time studies before any external use.

Competitive positioning

Marks in the positioning table are a positioning judgement, not a benchmark. Data residency is a go-to-market commitment to confirm with the hosting provider.

Market sizing

These figures are an illustrative model, not researched fact. Replace the construction counts and market value with primary sources — the Swiss Federal Statistical Office (BFS) and the

Schweizerischer Baumeisterverband (SBV) for Switzerland, Eurostat and Destatis for DACH, and industry analysts for spend per seat — before any investor use; investors will test them.

HARMAR operational scale

Supplier, contract, invoice, and document counts from the HARMAR project are approximate operational estimates from project execution — not audited statistics. They illustrate complexity and design input, not commercial traction.

Validation & traction

The engineering depth is real and shipped, and HARMAR acted as the first design environment — but commercial validation with independent customers is still ahead. Customer counts, letters of intent, and measured time saved per project manager are targets and next milestones, not results achieved yet.

HARMAR origin project

The HARMAR construction project is a real origin and design input for MAAT, but it is not yet a commercial customer case study. External validation with independent design partners remains the next milestone.

Product in practice

Links on this page open in-product documentation and live module areas — not embedded screenshots. Use a demo tenant or guided walkthrough for investor-facing visuals.

Funding ask

The funding amount, 18-month runway, ARR figure, and milestones are an illustrative target, not a committed plan. Confirm the amount and milestones against your own model.
